

How to install the app

A six-step walkthrough for opening the site and installing it to your home screen on Android. Takes about thirty seconds.

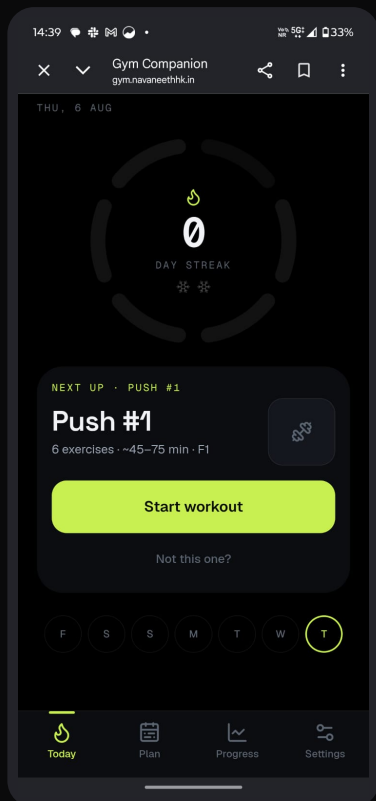

OPEN THIS LINK

gym.navaneethhk.in

What's inside

- 01 Open the link in Chrome
- 02 Open the browser menu
- 03 Tap Install and create shortcut
- 04 Choose Install
- 05 Launch it from your home screen
- 06 Pick a session and start

Android / Chrome. iPhone instructions are on the last page.

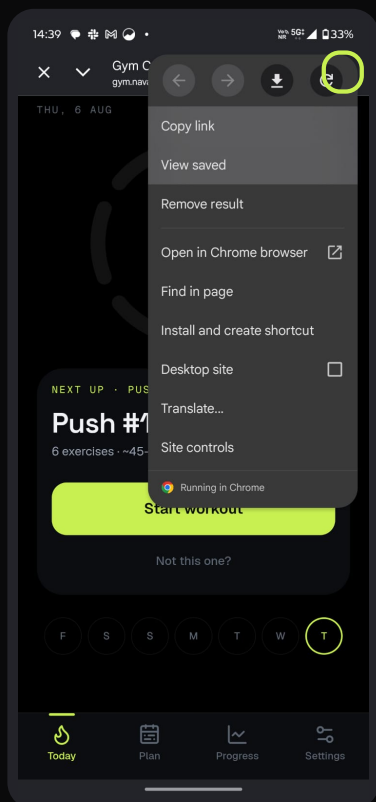

01

Open the link in Chrome

Type gym.navaneethhk.in into Chrome, or tap the link if someone sent it to you. The app loads straight away — no sign-up, no download yet.

You'll land on the Today screen with your streak ring and the next session queued up.

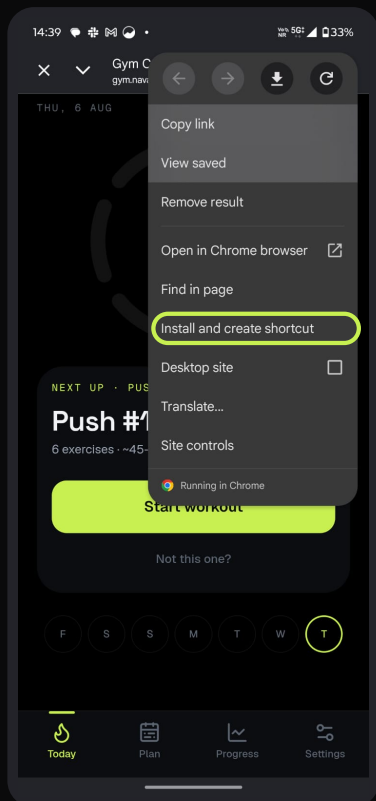

02

Open the browser menu

Tap the three dots in the top-right corner of the browser bar.

If you opened the link from inside another app (WhatsApp, Slack, Gmail), the menu looks slightly different but still has the same option.

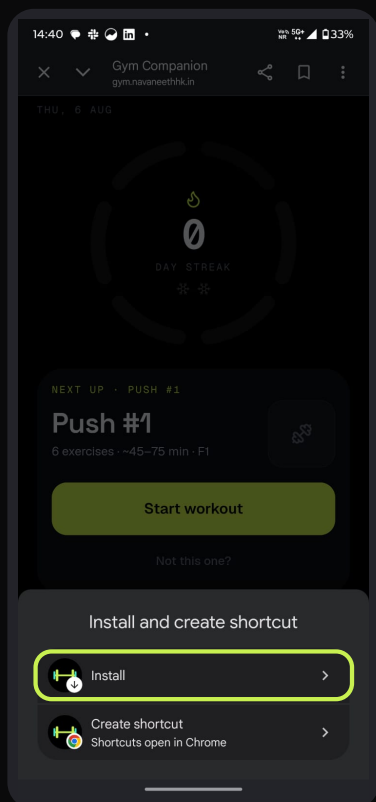

03

Tap “Install and create shortcut”

It sits about halfway down the menu, just under “Find in page”.

Don't see it? Reload the page once and try again — Chrome only offers this after the site has fully loaded.

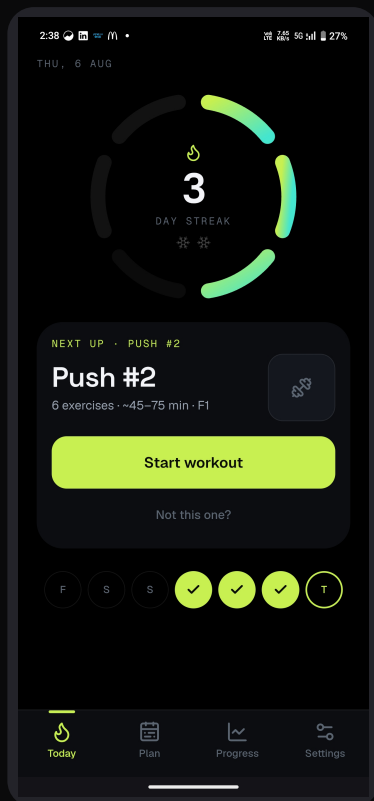

04

Choose “Install” — not “Create shortcut”

Two options appear at the bottom. Pick the first one.

Install gives you a real standalone app with no browser bar. Create shortcut just reopens Chrome every time, so your progress can end up split across two places.

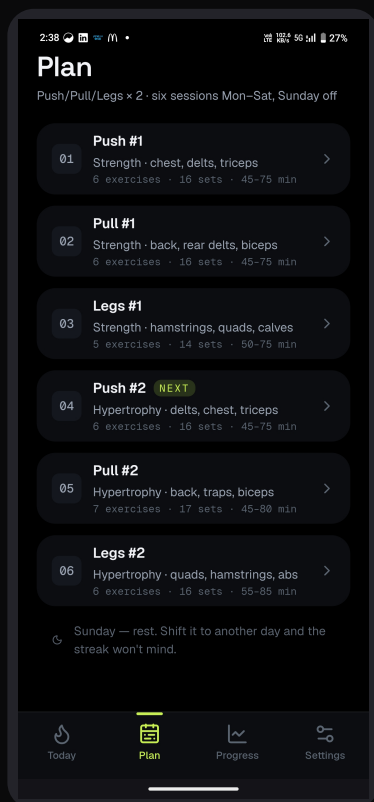

05

Launch it from your home screen

The dumbbell icon lands on your home screen and in your app drawer. Tap it.

Notice there's no browser bar now — it runs full screen, like any other app, and works offline once it has loaded.

06

Pick a session and start

The Plan tab holds the full six-day split: Push, Pull and Legs, twice each, Monday to Saturday.

Today's session is tagged NEXT. Tap Start workout on the Today tab, or open any session from here if you'd rather do a different one.

If something looks off

On iPhone

Chrome for iOS can't install web apps. Open gym.navaneethhk.in in Safari instead, tap the Share button at the bottom, scroll down and choose Add to Home Screen. Everything after that works the same.

The menu option isn't there

Reload the page and wait for it to finish loading, then reopen the menu. If you opened the link from inside another app, tap Open in Chrome browser first and try again from there.

My streak reset to zero

Progress is stored on the device, per browser. Opening the site in a different browser — or in an in-app browser rather than the installed app — shows a separate, empty copy. Always open the installed icon from your home screen and it will stay consistent.

Does it work offline?

Yes, once it has loaded at least once. Sessions you log while offline are kept on the device.

Removing it

Long-press the icon and choose Uninstall, same as any other app.
